

## CS150A Homework 3 – Writing

School of Information Science and Technology May 26, 2024

## 1 PARALLEL QUERY PROCESSING (20 PTS)

We've discussed 4 kinds of parallel join in class:

- **Parallel Hash Joins**: Use hash partitioning on both relations with the same hash function, then perform a normal hash join on each machine independently.
- **Parallel Sort Merge Join**: Use range partitioning with the same ranges on both relations, then perform sort merge join on each machine independently.
- One-sided shuffle Join: When one relation's data is already partitioned the way we want (hash partitioned or range partitioned on a key), just partition the other relation, then run local join (using any algorithm) at every node and union results.
- **Broadcast Join**: If one relation is small, send it to all nodes that have a partition of the other relation. Do a local join at each node (using any algorithm) and union results.

In shared nothing, the machines communicate with each other solely through the network by sending data to each other. Here, network cost is referred to the amount of data sent between machines.

Now we have a Relation R that has 10,000 pages, round-robin partitioned across 5 machines (M1, M2, M3, M4, M5). Relation S has 40 pages, all of which are only stored on M1. We want to join R and S on the condition R.col = C.col. Assume the size of each page is 1 KB.

- 1. (5 pts) Which type of join would have the lowest network cost in this scenario?(5 pts)
  - a) Parallel Hash Joins
  - b) Parallel Sort Merge Join
  - c) One-sided shuffle Join
  - d) Broadcast Join
- 2. (10 pts) How many KB of data must be sent over the network to join R and S using this join method?

  4x 40 = 160 KB

17 10 -100 142

B

- 3. (5 pts) Would the amount of data sent over the network change if R was hash or range partitioned among the 5 machines rather than round-robin partitioned using this join method?
  - a) The network cost will not change under both of the partitioning methods.
  - b) The network cost will change under both of the partitioning methods.
  - c) The network cost will only change under range partitioning.
  - d) The network cost will only change under hash partitioning.

## 2 DISTRIBUTED TRANSACTION (25 PTS)

Choose the correct answers for the following questions.

- 1. (8 pts) Imagine that during a distributed transaction that uses Two-Phase Commit, the following steps take place.
  - The coordinator asks every worker to PREPARE a transaction,
  - Every worker force-writes the PREPARE message,
  - And the coordinator crashes before taking any further action.

Which of the following statements is true?

- a) Modifications during the write are now visible to other transactions & commit
- b) The transaction will be committed when the coordinator recovers
- c) The transaction will be aborted when the coordinator recovers
- d) The transaction will be committed if more than half of the workers report the transaction as successful

~ q

- 2. (8 pts) Suppose we have a Coordinator and 4 Participants. When could the Coordinator **ABORT** a transaction?
  - a) The Coordinator has written ABORT in its log
  - b) The Coordinator sent PREPARE to all Participants and received 4 YES votes
  - c) The Coordinator sent COMMIT to all Participants and received 2 ACK but hasn't yet heard from the other nodes
  - d) A Participant has written ABORT in its log
  - e) A Participant has written COMMIT in its log
  - f) A Participant has voted YES
- 3. (9 pts) Suppose we have a Coordinator and 4 Participants. When could the Coordinator **COMMIT** a transaction?
  - a) The Coordinator has written ABORT in its log
  - b) The Coordinator sent PREPARE to all Participants and received 4 YES votes

- c) The Coordinator sent COMMIT to all Participants and received 2 ACK but hasn't yet heard from the other nodes
- d) A Participant has written ABORT in its log
- e) A Participant has written COMMIT in its log
- f) A Participant has voted YES

(D)

3 CONCURRENCY CONTROL (25 PTS)

1. (8 pts)Consider the schedule given below in Table 3.1. R(·) and W(·) stand for 'Read' and 'Write', respectively.

time	$t_1$	$\sqrt{t_2}$	$\sqrt{t_3}$	$t_4$	<i>t</i> <sub>5</sub>	$t_6$	$h_{\nabla}$	$t_8$	t <sub>9</sub>	$t_{10}$
$T_1$		(R(B)	/	W(C)	(W(A)	,			9	`
$T_2$	W(E)			R(E)		X	W(C)	R(D)	W(A)	)
$T_3$						R(A)	W(B)	7		R(B)
$T_4$			R(D)	(R(B))		W(D)	$\mathcal{A}$	/ '		

Table 3.1: A Schedule with 4 transactions

No serial. To occur when To not end.
 Tes, its conflict serolizable dependency graph is acyclic.
 No 291. To come acquire 5(A) before the

- a) (4 pts)Draw the dependency graph of the schedule given above.
- b) (4 pts)Is this schedule serial? Is this schedule conflict serializable? Is this schedule possible under regular 2PL? Explain your answer.
- 2. (17 pts)Consider the schedule given below in Table 3.2.  $S(\cdot)$  and  $X(\cdot)$  stand for 'shared lock' and 'exclusive lock', respectively.  $T_1$ ,  $T_2$ ,  $T_3$ , and  $T_4$  are four transactions. LM stands for 'lock manager'. Transactions will never release a granted lock

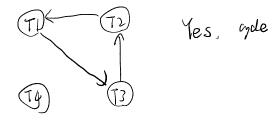

time	$t_1$	$t_2$	<i>t</i> <sub>3</sub>	$t_4$	$t_5$	<i>t</i> <sub>6</sub>	<i>t</i> <sub>7</sub>	$t_8$
$T_1$	S(B)	6					S(A)	
$T_2$		S(D)		_	X(B)			
$T_3$			X(A)	X(D)				S(C)
$T_4$			7			X(C) €		
LM	g							

Table 3.2: Lock requests of 4 transactions

a) (4 pts)For the lock requests in Table 3.2, determine which lock will be granted or blocked by the lock manager. Please write 'g' in the LM row to indicate the lock is granted and 'b' to indicate the lock is blocked, or the transaction has already been blocked by a former lock request. For example, in the table, the first lock (S(A)) at time  $t_1$ ) is marked as granted. Write your answer below:

time	$t_1$	$t_2$	$t_3$	$t_4$	$t_5$	<i>t</i> <sub>6</sub>	<i>t</i> <sub>7</sub>	<i>t</i> <sub>8</sub>
LM	g	9	9	Ь	Ь	9	Ь	b

b) (4 pts)Draw the waits-for graph for the lock requests in Table 3.2 and explain whether there is a deadlock.

3

To wants  $T_1 < V_0 T_1 < V_0 T_2 < V_0 T_3 < V_0 T_4$  works for  $T_1 < V_0 T_1 < V_0 T_2 < V_0 T_3 < V_0 T_4 < V_0 T_5 < V_0 T_4 < V_0 T_4 < V_0 T_5 < V_0 T_4 < V_0 T_5 < V_$ 

time	$t_1$	$t_2$	<i>t</i> <sub>3</sub>	$t_4$	$t_5$	<i>t</i> <sub>6</sub>	<i>t</i> <sub>7</sub>	<i>t</i> <sub>8</sub>
LM	g	g	9	a	a	9	9	-

d) (5 pts) Now we use the lock manager (LM) that adopts the Wound-Wait policy. We assume that in terms of priority:  $T_1 > T_2 > T_3 > T_4$ . Here,  $T_1 > T_2$  because  $T_1$  is older than  $T_2$  (i.e., older transactions have higher priority). Please mark 'g' for grant, 'b' for block (or the transaction is already blocked), 'a' for abort, and '-' if the transaction has already died. Write your answer below:

time	$t_1$	$t_2$	$t_3$	$t_4$	$t_5$	$t_6$	<i>t</i> <sub>7</sub>	$t_8$
LM	g	9	9	Ь	6	9	9	^

## 4 RECOVERY (30 PTS)

Your database server has just crashed due to a power outage. You boot it up, find the following log and checkpoint information on disk, and begin the recovery process. Assume we use a STEAL/NO FORCE recovery policy.

LSN	Record	prevLSN	
30	update: T3 writes P5	null	
40	update: T4 writes P1	null	
50	update: T4 writes P5	40	
60	update: T2 writes P5	null	
70	update: T1 writes P2	null	
80	begin_checkpoint	-	
90	update: T1 writes P3	70	
100	end_checkpoint	-	
110	update: T2 writes P3	60	
120	T2 commit	110	
130	update: T4 writes P1	50	
140	T2 end	120	
150	T4 abort	130	
160	update: T5 writes P2	null	·
180	CLR: undo T4 LSN 130	150	

Transaction Tab	ole	Dirty Page T	Dirty Page Table		
Transaction	lastLSN	Status	PageID	recLSN	
T1	70	Running	P5	50	
T2	60	Running	P1	40	
T3	30	Running			
T4	50	Running			

- 1. (10 pts) The log record at LSN 60 says that transaction 2 updated page 5. Was this update to page 5 successfully written to disk? The log record at LSN 70 says that transaction 1 updated page 2. Was this update to page 2 successfully written to disk?
- 2. (10 pts) At the end of the analysis phase, what transactions will be in the transaction table, and what pages will be in the dirty page table?
- 3. (10 pts) At which LSN in the log should redo begin? Which log records will be redone (list their LSNs)? All other log records will be skipped.
- don't sure update to page 5 have been written to disk since it was not written to disk at checkpoint and can be written later update pagez have been written to disk since P2 is no longer in DPI.
